The promise of the Semantic Web is that future web pages will be annotated not only with bright colors and fancy fonts as they are now, but with annotation extracted from large domain ontologies that specify, to a computer in a way that it can exploit, what information is contained on the given web page. The presence of this information will allow software agents to examine pages and to make decisions about content as humans are able to do now. The classic method of building an ontology is to gather a

committee of experts in the domain to be modeled by the ontology, and to have this committee agree on which concepts cover the domain, on which terms describe which concepts, on what relations exist between each concept and what the possible attributes of each concept are. All ontology learning systems begin with an ontology structure, which may just be an empty logical structure, and a collection of texts in the domain to be modeled. An ontology learning system can be seen as an interplay between three things: an existing ontology, a collection of texts, and lexical syntactic patterns. The Semantic Web will only be a reality if we can create structured, unambiguous ontologies that model domain knowledge that computers can handle. The creation of vast arrays of such ontologies, to be used to mark-up web pages for the Semantic Web, can only be accomplished by computer tools that can extract and build large parts of these ontologies automatically. This book provides the state-of-art of many automatic extraction and modeling techniques for ontology building. The maturation of these techniques will lead to the creation of the Semantic Web.

There is at present no universally accepted source giving definitions in English of the principal terms used in Production Control and in closely related areas. Most of the dictionaries and glossaries which do exist in this field fail to cover the full range of ideas which need to be considered during an intelligent discussion of the subject. Definitions

given in different sources for Production Control terms differ not only in wording, but also in many cases in the concepts which they cover. The IFIP Glossary is intended to meet this perceived need, the immediate audience for the book being IFIP WG 5.7, the working group concerned with the automation of Production Management and other related subjects. The Glossary is organised in the following way: - The subject field was classified into sub-fields by Management function. - Each of these sub-fields was analysed to discover the main concepts with which it is concerned. - Terms were selected for each concept, using as far as possible terms which are already in common use. - Definitions were selected or written for each term. This approach of starting with subject classification is believed to be new in the field of production. Care has been taken to check the Glossary with the APICS dictionary (USA), and with British standards. Notes are included in Part 2 to explain the reasons for selecting a particular meaning for a term, in those cases where there are wide differences in the meanings chosen by different sources. Some consensus about the meaning of words is essential for communication. On the other hand, there is a danger that if the accepted framework of meanings is too rigid, it may hinder the future development of the discipline. It is hoped that a reasonable balance has been found between these conflicting influences. The Glossary should be useful not only to WG 5.7 members, but also to Engineers and Academics in all countries where a knowledge of English is important to industrial development.
