All living things on Earth are composed of cells. A cell is the simplest unit of a self-contained living organism, and the vast majority of life on Earth consists of single-celled microbes, mostly bacteria. These consist of a simple 'prokaryotic' cell, with no nucleus. The bodies of more complex plants and animals consist of billions of 'eukaryotic' cells, of varying kinds, adapted to fill different roles - red blood cells, muscle cells, branched neurons. Each cell is an astonishingly complex chemical factory, the activities of which we have only begun to unravel in the past fifty years or so through modern techniques of microscopy, biochemistry, and molecular biology. In this Very Short Introduction, Terence Allen and Graham Cowling describe the nature of cells - their basic structure, their varying forms, their division, their differentiation from initially highly flexible stem cells, their signalling, and programmed death. Cells are the basic constituent of life, and understanding cells and how they work is central to all biology and medicine.

This revised workbook/lab text consists of 21 projects that can be executed with

readily available materials, a minimum of elaborate equipment and a reasonable amount of preparation time. Early projects deal with biochemistry and cytochemistry; the middle ones focus on organelles and their physiology; and later activities explore more advanced molecular topics such as restriction mapping strategies. New to this edition: a concise section on statistics covering the mean, standard deviation and standard error; and a chapter designed to enable students to write up their work as a lab report.

The Contento Experimental Cell Biology Lab Book is a modular design that matches the topics discussed in Karp's textbook. The manual itself consists of 30+ experiments that coincide and complement each of the 18 chapters in the Karp text. There are three possible designs of the lab book, based on the instructor's needs. These designs focus on either Techniques, Concepts, or Organelles. The procedures of the 30+ experiments remain standard and unchanged in all designs of the lab book. Special Overview pages, Discussion Questions and Datasheets bookend the procedures in order to create each of the possible textbook designs. This gives instructors flexibility to create a lab book that suits their lecture course curriculum, their experience, and available equipment and supplies.
