Handbook of Signal Processing Systems is organized in three parts. The first part motivates representative applications that drive and apply state-of-the art methods for design and implementation of signal processing systems; the second part discusses architectures for implementing these applications; the third part focuses on compilers and simulation tools, describes models of computation and their associated design tools and methodologies. This handbook is an essential tool for professionals in many fields and researchers of all levels.

A number of thermodynamic books claiming to be original in both presentation and approach have been published. However, thermodynamics is still a confusing subject for uninitiated students and an "easy-to-forget" one for graduate engineers. In order to solve these problems, this computer aided learning package — textbook and CD-ROM — takes a new approach.This package is unique and beneficial in that it simulates a classroom lecture: it actually writes important equations and concepts on a virtual board, underlines, draws circles, places ticks to emphasise important points, draws arrows to indicate relationships, uses colours for visual effect, erases some parts to write new lines, and even repeats some parts of the lesson to stress their importance. This realistic simulation is made possible by the employment of the multimedia capabilities of the modern-day computer. Readers are not just passively presented with thermodynamics, they can also interactively select and repeat any particular topic of interest as many times as they want. This flexibility allows readers to choose their own pace of presentation. This complementary set is in many important respects better than the books that are currently available on the subject.

This book provides a comprehensive yet easy coverage of ad hoc and sensor networks and fills the gap of existing literature in this growing field. It emphasizes that there is a major interdependence among various layers of the network protocol stack. Contrary to wired or even one-hop cellular networks, the lack of a fixed infrastructure, the inherent mobility, the wireless channel, and the underlying routing mechanism by ad hoc and sensor networks introduce a number of technological challenges that are difficult to address within the boundaries of a single protocol layer. All existing textbooks on the subject often focus on a specific aspect of the technology, and fail to provide critical insights on cross-layer interdependencies. To fully understand these intriguing networks, one need to grasp specific solutions individually, and also the many interdependencies and cross-layer interactions.

It has been always an incentive for students to find whether his/her efforts to solve exercises give correct results, or to find tips for problems that he/she finds more difficult. Best-selling author Mike Robbins had a life that many little boys dream of. Drafted by the New York Yankees directly out of high school, Mike decided instead to postpone his professional baseball career until he finished college. After a successful stint at Stanford, he began life in the minor leagues as a pitcher with the Kansas City Royals organization, where he played for three years until an injury benched him for good. This devastating disappointment changed his life in wonderful ways that he could have never imagined. He now teaches and speaks around the world about teamwork, emotional intelligence, and the value of appreciation and authenticity. In Nothing Changes Until You Do, Mike's third book, he looks at one of the most important and challenging aspects of life—our relationship with ourselves. Even the most successful person struggles with this delicate relationship, which has created an epidemic of self-criticism, self-doubt, and thinking that our value is directly connected to the external world—our jobs, our finances, our appearance, our accomplishments, and so on. Through 40 short essays, Mike shows readers that none of this is true, and brings to light a new way to look at life. With themes spanning from the importance of trusting yourself to the benefits of vulnerability to the strength inherent in embracing powerlessness and change, Mike will help readers get out of their own way, so they can live a good life. He shows that with a little self-compassion and a healthy dose of self-acceptance, anyone can turn away from the negatives that manifest because of a critical self-perception—things like unkindness, addictions, sabotaged relationships, unnecessary drama, and more. Making peace with ourselves is fundamental to happiness. The suggestions, insights, and reminders of this book will allow readers to have more compassion, more acceptance, and more love for themselves—thus giving them access to more compassion, more acceptance, and more love for the people (and everything else) in their lives.

The annual International Conference on Global Security, Safety and Sustainability (ICGS3) is an established platform in which security, safety and sustainability issues can be examined from several global perspectives through dialogue between acad- ics, students, government representatives, chief executives, security professionals, and research scientists from the United Kingdom and from around the globe. The three-day conference focused on the challenges of complexity, rapid pace of change and risk/opportunity issues associated with modern products, systems, special events and infrastructures. The importance of adopting systematic and systemic - proaches to the assurance of these systems was emphasized within a special stream focused on strategic frameworks, architectures and human factors. The conference provided an opportunity for systems scientists, assurance researchers, owners, ope- tors and maintainers of large, complex and advanced systems and infrastructures to update their knowledge on the state of best practice in these challenging domains while networking with the leading researchers and solution providers. ICGS3 2010 received paper submissions from more than 17 different countries in all continents. Only 31 papers were selected and were presented as full papers. The program also included a number of keynote lectures by leading researchers, security professionals and government representatives.

Reading Migration and Culture locates itself within the recent preoccupation in literary studies with modernity, migration and diaspora, and the theories that are deployed in trying to account for them. Its central argument is that 'global' readings of migration in relation to a general 'postcolonial condition' elides local referents of history, social life and geography. East African Asians, a term used to refer to people of sub-continental Indian descent in the region, occupy an important, yet often neglected role, in the history of the former British Empire. Unlike their counterparts in the Caribbean, Fiji and South Africa, they have had a closer connection to the India, which has been an important focus of their imagination. This book examines the local histories and discourses that underpin East African Asian literature against the categories that have evolved for conceptualizing diaspora, especially within postcolonial studies. Its focus is on the cultural codes that diasporic East African Asians have forged in an attempt to come to terms with a history of dislocation and how those codes find form in writing. In probing these issues, it opens up larger questions of alienation, domesticity, material culture, gastropolitics, memory, nationalism and the allegorical construction of gender and sexuality. In a significant sense, this book shows that East African Asian writing is rooted in a fundamental sense of the local East African scene but at the same time draws its identity from a wider cartography that includes the Indian sub-continent, Africa and the Euro-American sites in which the majority of the writers live. Writers covered include M.G. Vassanji, Yasmin Alibhai-Brown, Nanji Kalidas Mehta, Peter Nazareth, Jameela Siddiqi, Shailja Patel, Bahadur Tejani and Ghalib Shiraz Dhalla.
