Designed for teaching astrophysics to physics students at advanced undergraduate or beginning graduate level, this textbook also provides an overview of astrophysics for astrophysics graduate students, before they delve into more specialized volumes. Assuming background knowledge at the level of a physics major, the textbook develops astrophysics from the basics without requiring any previous study in astronomy or astrophysics. Physical concepts, mathematical derivations and observational data are combined in a balanced way to provide a unified treatment. Topics such as general relativity and plasma physics, which are not usually covered in physics courses but used extensively in astrophysics, are developed from first principles. While the emphasis is on developing the fundamentals thoroughly, recent important discoveries are highlighted at every stage.

Kenneth Waltz's 1979 Theory of International Politics is credited with bringing about a "scientific revolution" in the study of international relations – bringing the field into a new era of systematic study. The book is also a lesson in reasoning carefully and critically. Good reasoning is exemplified by arguments that move systematically, through carefully organised stages, taking into account opposing stances and ideas as they move towards a logical conclusion. Theory of International Politics might be a textbook example of how to go about structuring an argument in this way to produce a watertight case for a particular point of view. Waltz's book begins by testing and critiquing earlier theories of international relations, showing their strengths and weaknesses, before moving on to argue for his own stance – what has since become known as "neorealism". His aim was "to construct a theory of international politics that remedies the defects of present theories." And this is precisely what he did; by showing the shortcomings of the prevalent theories of international relations, Waltz was then able to import insights from sociology to create a more comprehensive and realistic theory that took full account of the strengths of old schemas while also remedying their weaknesses – reasoning out a new theory in the process.

In 1952, at the age of 23, Helen Frankenthaler created her legendary painting Mountains and Sea. She poured thinned-down pigment directly onto unprimed canvas to be absorbed into its fibers. This large painting, the first in which Frankenthaler used her soak-stain technique, synthesized the influences that had informed her work to that point and announces her arrival as a mature artist. Published to accompany a 1998 exhibition at the Solomon R. Guggenheim Museum, New York, this book focuses on Mountains and Seaand other groundbreaking paintings of Frankenthaler's early career. In this period, Frankenthaler drew upon Cubism, the abstractions of Arshile Gorky and, especially, those of Jackson Pollock, whose radical technique inspired her to reject easel painting. Frankenthaler herself became associated with the second generation of the New York School and her unique method and experimental use of materials influenced her contemporaries and subsequent generations of artists.
