Mohs Micrographic Surgery, an advanced treatment procedure for skin cancer, offers the highest potential for recovery—even if the skin

cancer has been previously treated. This procedure is a state-of-the-art treatment in which the physician serves as surgeon, pathologist, and reconstructive surgeon. It relies on the accuracy of a microscope to trace and ensure removal of skin cancer down to its roots. This procedure allows dermatologists trained in Mohs Surgery to see beyond the visible disease and to precisely identify and remove the entire tumor, leaving healthy tissue unharmed. This procedure is most often used in treating two of the most common forms of skin cancer: basal cell carcinoma and squamous cell carcinoma. The cure rate for Mohs Micrographic Surgery is the highest of all treatments for skin cancer—up to 99 percent even if other forms of treatment have failed. This procedure, the most exact and precise method of tumor removal, minimizes the chance of regrowth and lessens the potential for scarring or disfigurement

This pocket guide presents more than 500 surgical procedures! State-of-the-art revisions familiarize the reader with new standards of excellence for care of the surgical patient in the perioperative environment. For each procedure, you'll find a definition, discussion, description of the surgery, preparation of the patient, skin preparation, draping technique, instrumentation, supplies, and special notes pertinent to that surgery.

This exam review questions' book is a compilation of more than 500 questions ranging from ethical issues, anatomy and physiology, surgical asepsis, to patient care during surgery. A thorough review of these questions will prepare the surgical technician to sit for the national certifying exam.
